

CSM application can be configured to name deployed applications in software center. By default naming contains applications publisher, name, version, language and architecture. This can be changed if applications should be named in application catalog using different format. Also application description that is shown on software center can be defined in CSM configuration.

Decide how applications should be named in software center and how description of the application should be created. This information is needed when CSM is installed if default values are not sufficient.

Default values

- Application name: [PUBLISHER] [NAME] [VERSION] [LANGUAGE]
[ARCHITECTURE]
- Application description: [PUBLISHER] [NAME] [VERSION] [LANGUAGE]
[ARCHITECTURE] ([INSTALLERTYPE])
