# Application Cannot Find The Installation Media Of The Previous Version

Last Modified on 27/05/2022 1:58 pm EEST

Problem:

- An application installation might sometimes need the installation media of the previous version, in order to update it. If the installation media is already removed from ccmcache, installation might fail.

-

Solution:

- MECM client can use MECM distribution point as an alternative package source if the installation media was already removed from original source (ccmcache).
- MECM source management doesn't work if communication between distribution point and the client is secured. Make sure your distribution points communication is set to **HTTP** with "**Allow clients to connect anonymously**" selected
