

Application Settings

Last Modified on 21/10/2022 10:34 am EEST

software

Software Center

- **Application category** - Allows you to select application category to application from Configuration Manager
- **Application Description in software center** - With this option you can add an description visible in software center
- **Application Name** - With this option you can configure the application naming scheme visible in software center
- **Application help documentation in software center** - Configure URL or network path to allow users to find more information of the application

Content locations

- **MECM root folder for packages** - Name of the folder that appears in the MECM console in Applications section. All the imported 3rd party packages will be placed into it
- **Distribution point group** - Target distribution point group for application media distribution

Supersedence

- **Superseding** - can be set to **all previous versions**, **all active previous versions**, **only previous versions** or **none**. Default setting **all active previous version** will supersede only previous versions that are active in MECM
- **Supersede version exclude** - If you don't want to supersede a specific application version, you can set the specific version. You can also use regular expressions to match multiple versions
- **Uninstall superseded** - Set this to **true** to uninstall superseded application versions before the installation, but we recommend leaving this to **false**. CSM applications can update previous versions without the uninstall option. Automatic task sequence update feature will not work if you set this to **true**

Cleanup

- **Clean previous version** - Configure how CSM should cleanup previous applications. You have 5 options:
 - Never
 - Remove deployments, supersedences and retire when latest available.
 - Remove deployments, supersedences and retire when latest required. (Default)
 - Remove deployments, supersedences when latest available.
 - Remove deployments, supersedences when latest required.
- **Retired cleanup** - Configure whether or not CSM should remove old application version from Configuration Manager and files from content location. Can be set to **Do nothing** (Default) or **Remove retired applications and media**.

- With **Remove retired applications and media** option CSM will automatically remove retired versions of the application from MECM and installation files from server.
- Cleanup will remove only CSM created applications
- **Retired cleanup setting is available in 1.0.5085 and later**
- **Revision cleanup** - Configure whether or not CSM should remove unnecessary application revisions before deploying the application. Set to **True** (default) or **False**
 - **Revision cleanup setting is available in 1.0.5085 and later**

The screenshot shows the Centero Software Manager interface. The title bar reads "Centero Software Manager" with standard window controls. The main window has a header with "Centero Software Manager" and the "software manager" logo. Below the header are tabs for "Overview", "MECM Integration", "Settings", "Email Templates", and "Scheduled Tasks". The "Settings" tab is active, showing a tree view on the left under "MECM Settings" with "1st CSM Group" selected. The main area is titled "Application settings" and contains several sections: "Software center" with fields for Application category, Application Description, Application Name, and Application help documentation; "Content locations" with fields for MECM root folder and Distributionpoint group; "Supersede" with dropdowns for Superseding, Supersede version exclude, and Uninstall Superseded; and "Cleanup" with dropdowns for Clean previous versions, Retired cleanup, and Revision cleanup. The "Revision cleanup" dropdown is set to "True". At the bottom right are "Apply" and "Close" buttons.
