

FAQ - CSM for Intune

Last Modified on 06/05/2022 9:12 am EEST

Does CSM for Intune require server or agent installation?

No. All you need is two enterprise applications to your Azure AD and you are ready to configure CSM.

What applications does CSM for Intune support?

You can see the list of our supported applications from [here](#).

How can I suggest a new application to CSM's application catalog?

You can suggest new applications from [Centero Portal](#) -> **Services** -> **CSM for Intune** -> **Administration** -> **Service Applications**. We will evaluate the suggested application and if the application meets our criteria, we will add it to our application catalog.

If the application didn't meet our supported application criteria's, you can still get it by ordering the application as a customer specific application. You can order it from [Centero Portal](#) -> **Order** -> **Application Packaging** and select **Application packaging as a service** as packaging type.

[Read more](#) about application packaging as a service.

How can I update applications that I've deployed to Intune's Company Portal?

If you deploy an application to a user group with available type deployment and users install it from Company Portal, upcoming application versions are not automatically installed to those devices. With CSM for Intune you can use our **Application Groups** feature to solve the issue.

When a user installs CSM created application from Company Portal, CSM's Application Groups feature adds the device to a application specific Azure AD group. You can then deploy the application to the application specific group with required deployment.
