

Application Settings

Last Modified on 28/10/2022 12:37 pm EEST

From application settings, you can configure installation parameters and other application settings that are available in Intune. You can configure application settings by navigating to **Services** -> **CSM for Intune** -> **Administration** -> **Deployment processes** page in Centro Portal and selecting a deployment process. Open application settings by selecting settings icon next to a application name.

You can configure the following application settings:

App information

- **Description**
 - Description is visible for the end user in the Company Portal app

- If no description is set, CSM for Intune will default to *Application [APP NAME] published by integration client* description
- **Show as featured app**
 - Display the app prominently in the Company Portal

Program

- **Install parameters**
 - These parameters will be added to the end of the installation command in Intune
 - With parameters, you can for example enable windows installer logging and configure application installer properties
 - The full installation command would look like this in Intune, if you've configured `/!*v` `%WINDIRD%\CSM_Reader_Install.log` parameter:
 - `msiexec /qn /i filename.msi TRANSFORMS="filename.mst" /!*v`
`%WINDIRD%\CSM_Reader_Install.log`
- **Uninstall parameters**
 - These parameters will be added to the end of the uninstallation command in Intune
- **Restart behavior**
 - Change the restart behavior of the application in Intune. Read more from [here](#)
 - App install may force a device restart
 - Determine behavior based on return codes (Default if not set)
 - No specific action
 - Intune will force a mandatory device restart

Application settings will be the same in all deployment processes for the same application
